### APPLICATION AND USE

Multiprotocol I/O modules of the MIX-IP series are designed to create distributed control systems by extending the capabilities of building controllers like MAC36NL, iSMA-B-J8, or AAC20 with inputs and outputs, using an IP connection and open communication protocols, BACnet IP and Modbus TCP/IP. All the MIX series modules are equipped with the types of I/Os most commonly used in building automation (MIX of all types of I/Os in one unit). The factory-equipped, most popular open communication protocols, Modbus and BACnet, are selected using a DIP switch. Modules in the MIX-IP series are equipped with two Fast Ethernet interfaces working in a switch mode, allowing for a daisy chain connection of multiple units. Additional RS485 interface has an added functionality, the Modbus TCP/IP to Modbus RTU/ASCII gateway, enabling the connection of additional modules/devices, which communicate as servers (slaves) on the serial bus. The Modbus gateway functionality is active both when the module is operating in the Modbus and BACnet mode. The MIX-IP modules, communicating either in Modbus or BACnet, are always client (master) units on the network. One major advantage of supporting the modules with open communication standards is the versatility to install them in both new and completed installations, as part of an existing BMS. The modules are addressed using rotary switches, which facilitates and accelerates the process of commissioning the system. Built-in mini USB allows for the initial configuration of the unit without a power supply.
